This clone was sequenced as part of a high-throughput process to sequence 2000). The sequence has been subjected to integrity checks for sequence clones from Drosophila Gene Collection 1 (Rubin et al., Science 2000). The sequence has been subjected to integrity checks for sequence accuracy, presence of a polyA tail and contiguity within 100 kb in the genome. Thus we believe the sequence to reflect accuracity principle particular cDNA clones that may have not been detected in our initial analyses such as internal priming from contaminating genomic DNA, retained introns due to reverse transcription of unspliced precursor RNAS, and reverse transcription of unspliced precursor RNAS, and reverse transcription about this sequence, including its location and relationship to other sequences, please visit our Web site (http://fruitfly.berkeley.edu) or send email to Location/Qualifiers

This clone was sequenced as part of a high-throughput process to
Berkeley, CA 94720
This clone was sequence date of a polyA tail and contiguity
Consequence clones from Drosophila Gene Collection 1 (Rubin et al.,
Science 2000). The sequence has been subjected to integrity checks
for sequence accuracy, presence of a polyA tail and contiguity
within 100 kb in the genome. Thus we believe the sequence to reflect accurately this particular cDNA clone. However, there are artifacts associated with the generation of CDNA clones that may have not been detected in our initial analyses such as internal priming, priming from contaminating genomic DNA, retained introns due to reverse transcription of unspliced precursor RNAs, and reverse transcription of unspliced precursor RNAs, and reverse transcription errors that result in single base changes. For further information about this sequence, including its location (http://fruitfly.berkeley.edu.) or send email to consequences.

Incationally contaminities of the consequences of t
                                                                                                                                            1840

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             g
                                                                                                                                                                                                                                                                                                                                      The invention describes an isolated tumour necrosis factor polypeptide

(TNF) The polypeptide and polynucleotide are useful in controlling

agriculturally important peets, particularly by modifying the growth,

feeding and/or reproduction of crop-damaging insects or insects of farm

animals. The polypeptide and polynucleotide are useful for modulating

cepithehial morphogenesis, cell-matrix adhesion in files and mammals. Thus

the polypeptide and polynucleotide may be useful for recating,

ameliorating or preventing X-linked anhidrotic (hypohidrotic) ectodermal

dysplasia and X-linked anhidrotic (hypohidrotic) ectodermal

dysplasia and X-linked anhidrotic (hypohidrotic) ectodermal

ike disorders, e.g. sparse hair, abnormal or missing teeth or sweat

gland aberrations in animals (e.g. insects and potentially humans),

endocoxic shock, inflammation, haemorrhagic necrosis of tumours,

cytotoxicity and obesity-linked insulin resistance, all of which involve

TNF molecules. This sequence encodes the drosophila melanogaster tumour

recosis factor variant 2 (TNFv2) protein, described in the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention describes an isolated tumour necrosis factor polypeptide (TNF) The polypeptide and polynucleotide are useful in controlling agriculturally important pests, particularly by modifying the growth feeding and/or reproduction of crop-damaging insects or insects of farm animals. The polypeptide and polynucleotide are useful for modulating ceptihelial morphogenesis, cell-matrix adhesion in flies and mammals. Thus the polypeptide and polynucleotide may be useful for treating, ameliorating or preventing X-linked anhidrotic (hypohidrotic) ectodermal dysplasia-liked annidrotic (hypohidrotic) ectodermal dysplasia-like disorders, e.g. sparse hair, abnormal or missing teeth or sweat gland aberrations in animals (e.g. insects and potentially humans), condotoxic shock, inflammation, haemorrhagic necrosis of tumours, cytotoxicity and obesity-linked insulin resistance, all of which involve TNF molecules. This sequence encodes the drosophila melanogaster tumour
                                                                                   Tumour necrosis factor; TNF; pesticide; crop-damaging insect; farm animal insect; epithelial morphogenesis; cell-matrix adhesion; X-linked anhidrotic (hypohidrotic) ectodermal dysplasis; sparse half, sweat gland aberration; endotoxic shock; inflammation; haemorrhagic necrosis of tumour; cytotoxic shock; inflammation; obesity-linked insulin resistance; gene; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New Drosophila tumor necrosis factor molecule, useful in controlling agriculturally important pests, e.g. comprises modifying the growth, feeding or reproduction of crop-damaging insects or insects of farm animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       factor variant 1(TNFv1) protein, described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              MΑ;

```
The invention describes an isolated tumour necrosis factor polypeptide (TNF). The polypeptide and polymucleotide are useful in controlling agriculturally important peets, particularly by modifying the growth, feeding and/or reproduction of crop-damaging insects or insects of farm animals. The polypeptide and polymucleotide are useful for modulating captupential and polymucleotide may be useful for modulating the polypeptide and polymucleotide may be useful for treating the polypeptide and polymucleotide may be useful for treating crop-damaging ameliorating or preventing X-linked anhidrotic (hypohidrotic) ectodermal dysplasial and X-linked anhidrotic (hypohidrotic) ectodermal dysplasial and X-linked anhidrotic (hypohidrotic) ectodermal dysplasial its disorders, e.g. sparse hair abnormal or missing teeth or sweat gland aberrations in animals (e.g. insects and potentially humans), endocatic shock, inflammation, haemorrhagic necrosis of tumours, cytotoxicity and obseity-linked insulin resistance, all of which involve TNF molecules. This sequence encodes the drosophila melanogaster tumour necrosis factor (TNF) protein, described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  rcreregargargregececaeacraceaegacraceceararerraaaraaercaac 1131
